Unraveling Linear Relationships: Regression Analysis with SEMMA

Nick Kornienko

September 21, 2023

Abstract

This paper delves into a detailed regression analysis using the SEMMA methodology on a dataset to understand the linear relationship between the independent variable x and the dependent variable y. The focus is also on addressing the nuances and intricacies of the dataset, including handling missing values to ensure reliable model training and predictions.

1 Introduction

Understanding relationships between variables is a cornerstone in data science. This paper focuses on exploring and modeling the linear association between variables x and y using the structured SEMMA methodology.

2 Exploration and Modification

The exploration phase unveiled the dataset's structure and the presence of missing values in the target variable y. These were addressed by removing rows with missing target values, ensuring the robustness and reliability of the subsequent modeling phase.

3 Modeling and Assessment

A Linear Regression model was employed and optimized to predict the target variable y. The assessment was conducted using the Mean Squared Error, offering insights into the model's reliability and the average squared difference between the actual and predicted values.

4 Conclusion

The structured approach of the SEMMA methodology allowed for comprehensive exploration and analysis, addressing the dataset's specific nuances and en-

suring the model was well-understood, optimized, and assessed. This methodology proved pivotal in uncovering underlying patterns and relationships in the dataset, leading to reliable and insightful predictions.
